Prove that the TSP (Traveling Salesman) problem is NP-Complete by reduction to the Hamiltonian Cycle problem. Always reduce from KNOWN to NEW; Reduce from HAMCYCLE to TSP, -2

Hamiltonian Cycle Problem:

Input: An un-weighted graph G

Output: Does there exist a simple tour that visits every vertex of G without repetition? Repetition of what? Edges? Vertices? -1

Prove that TSP is NP-Complete via reduction

Step 1: (Verification) Show that $TSP \in NP$

The TSP problem: $TSP = \{ \langle G, c, k \rangle : G = (V, E) \text{ is a complete graph, } c \text{ is a function } V \times V \rightarrow Z, k \in Z \text{ and } G \text{ has a traveling salesman tour with cost at most } k \}$

Given a tour $h = (v_1, v_2, v_3, \dots, v_n)$ and a cost k , we need to check for two conditions

1. The tour visits every city (vertex) in the graph and returns to the starting point
2. Cost k is not exceeded by the tour
3. also need to show no repetition of vertices in h , -2

Pseudo-code:

```
Part 1: --- 0(n^2)
// identify that every city is visited
for j = 1 ... |V|:
    vertex_present = false
    for i = 1 ... n
        // test if present
        if ( h[i] contains vertex(j) ):
            vertex_present = true
    if vertex_present == false:
        fails to be a tour
```

```
Part 2: --- 0(1)
// test that we end where we began
if ( h[0] = h[n] ):
    valid_tour = true
```

```
Part 3: --- 0(n)
// determine total cost for tour h
cost = 0
for i = 0 ... (h-1):
    cost = cost + d( v_i, v_(i+1) )
```

```

if ( cost > k ):
    fails to be a tour of cost <= k

```

Therefore given a graph, we can decide if a tour has cost at most k in $T(n) = O(n^2)$. **what is n?, -1**Therefore, TSP is verifiable in polynomial time.

Step 2: Reduction

We will use the HAM-CYC problem which is known to be NP-Complete and show there exists a polynomial reduction to the TSP problem.

Let $G = (V, E)$ be an input instance of the HAM-CYC problem with $|V| = n$. **Cannot do reduction from specific instance of HAM-CYC. Should be general instance of HAMCYCLE -5**Then we will construct a complete weighted graph $G' = (V, E')$ such that if an edge $e_i \in E$ then the weight of $e_i = 1$ in E' and if the edge was not in E then the weight of $e_i = 2$.

The reduction to TSP can be implemented in polynomial time $O(|V| \times |V|) = O(n^2)$

Pseudocode:

```

for i = 1 to |V| do
    for j = 1 to |V| do
        if ( i,j ) in E then w(i,j) = 1 else w(i,j) = 2

```

Therefore, $G = (V, E) \rightarrow T(n) = O(n^2) \rightarrow G' = (V, E')$

Step 3: Correctness

Claim: The graph G has a Hamiltonian cycle if and only if there is a TSP tour of G' of weight exactly n .

Suppose that the graph G' has a Hamiltonian cycle h . Then each edge in h belongs to E and has a cost associated with it of 1 in G' . Also, by definition, every vertex in V is visited by the cycle h . Thus, h is a tour in G' of cost $|V| = n$.

Now suppose that the graph G' has a tour h' of cost exactly n . Then, since the edges in h' **you defined h to be a sequence of vertices, not edges, -1**are found in E' and the total cost is exactly n , then each edge in h' has cost 1. This means that every edge in h' is also in E . And since the tour implies that every city is visited, we conclude that h' must also be a Hamiltonian cycle in graph G .
